

'RCK'

Reverse Control Kit

The 'RCK' enables an owner to limit the active cleaning zone for the SonicAire fan by reversing the rotation of the fan with two proximity targets and one limit switch. The proximity targets can be mounted on the top gear at the angle you want to actively clean. The active cleaning zone can range from 30 degrees to 330 degrees. The range of angle can easily be adjusted in the field by relocating one of the proximity targets.
